TISSUE SPECIFICITY: POSTEMBRYONIC EXPRESSION IS STRONG IN T
DEVELOPING OPTIC LOBE AND IN THE EYE IMAGINAL DISC.
DEVELOPMENTAL STACE: STRONGLY EXPRESSED IN EMBRYOS. ALSO FO
IN LATE LARVAL AND PUPAL STAGES.
SIMILARITY: CONTAINS 5 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION:

1- FUNCTION: MAY FUNCTION AS A CELL ADHESION MOLEC
THE CATALYTIC ACTIVITY OF TYROSINE KINASE.

1- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

1- TISSUE SPECIFICITY: EXPRESSED IN BONE MARROW, STRYMUS AND BRAIN. WEAKLY EXPRESSED IN FIBROBLAS
IN EMBRYONIC LIVER.

1- SIMILARITY: CONTAINS 7 IMMUNOGLOBULIN-LIKE C2-7

1- SIMILARITY: BELONGS TO THE INSULIN RECEPTOR FAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              645

-i- FUNCTION: THIS PROTEIN IS A CELL ADHESION MOLECULE INVOLVED NEURON-NEURON ADHESION, NEURITE FASCICULATION, OUTGROWTH OF NEURITES, ETC.

-i- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-i- ALTERNATIVE PRODUCTS: THE DIFFERENT TISSUE-SPECIFIC FORMS OF N-CAM ARE PRODUCED BY ALTERNATIVE SPLICING.

-i- SIMILARITY: CONTAINS 5 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAINS.
-i- SIMILARITY: CONTAINS 7 FIBRONECTIN TYPE III-LIKE DOMAINS.
-I- LAUTION: WAS ORIGINALLY (REF. 1) THOUGHT TO BE A CALMODULIN-INDEPENDENT ADENYLATE CYCLASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. FUNCTION: CELL ADHESION MOLECULE THAT BINDS TO CD6. INVOLVED IN NEURITE EXTENSION BY NEURONS VIA HETEROPHILIC AND HOMOPHILIC INTERACTIONS. MAY PLAY A ROLE IN THE BINDING OF TAND B CELLS TACTIVATED LEUKOCYTES, AS WELL AS IN INTERACTIONS BETWEEN CELLS THE NERVOUS SYSTEM. MAY BE INVOLVED IN OSTEOGRESSIS. MAY PLAY A IMPORTANT ROLE IN THE DEVELOPMENT OF A VARIETY OF MESENCHYMAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TISSUES (BY SIMILARITY).
